

# MPOD HV

## Power Supply System

---

## Technical Manual

## **General Remarks**

The only purpose of this manual is a description of the product. It must not be interpreted as a declaration of conformity for this product including the product and software.

**W-le-Ne-R** revises this product and manual without notice. Differences of the description in manual and product are possible.

**W-le-Ne-R** excludes completely any liability for loss of profits, loss of business, loss of use or data, interrupt of business, or for indirect, special incidental, or consequential damages of any kind, even if **W-le-Ne-R** has been advised of the possibility of such damages arising from any defect or error in this manual or product.

Any use of the product which may influence health of human beings requires the express written permission of **W-le-Ne-R**.

Products mentioned in this manual are mentioned for identification purposes only. Product names appearing in this manual may or may not be registered trademarks or copyrights of their respective companies.

No part of this product, including the product and the software may be reproduced, transmitted, transcribed, stored in a retrieval system, or translated into any language in any form by any means with the express written permission of **W-le-Ne-R**.

## **Control Cabinet**

In the context of this user manual, the control cabinet must fulfill the requirements on fire-protective enclosures according to EN 60950 / IEC 60950 / UL 60950.

All devices are intended for operation in control cabinets or in closed areas. The LAN connection and all wire connections between the different system parts must be done via shielded cable with conductive connector shells, which are fixed with screws.

Furthermore, an additional fire-protective enclosure is required which must not affect proper air circulation.

## **Mains Voltage and Connection**

The Power supplies are equipped with a "World"- mains input (rated voltage range: 100-240

VAC, frequency: 50-60 Hz, rated current: 16 A). Before connecting to the mains please double-check correspondence.

Mains input connection at the power supply side is done with a 3-pin HIRSCHMANN connector or power terminals. There is no main fuse inside. A circuit breaker for overcurrent protection 16A, type B or C (EN / IEC 60898, VDE 0641), has to be installed externally.

Before disconnection the HIRSCHMANN connector, the power supply should be switched into standby state. (Use the ON/OFF-Switch of the front pannel of the MPOD system)

Hirschman n.	Signal	Description	Color of the Wire
Pin 1	L	Phase	black or brown
Pin 2	N	Return, Neutral	blue
Pin 3		not connected	
Earth	PE	Protective Earth	green/yellow

### Connection to Earth

#### Safety

After connecting the Power box to the mains, the mains input module is powered permanently. Filter and storage capacitors of the power factor correction module are charged with about **400VDC**. Any DC-On-Signal as well as a power switch at control board (if any installed) operates as a low voltage DC on/off switch only and not as a mains breaker. **Therefore it becomes dangerous if the box cover is open. In this case a lot of components on high voltage potential get touchable!**

**Before starting any kind of work inside the power box remove the unit from mains and wait a couple of minutes with your activities! Discharge the primary DC Filter-capacitors by use of a well isolated 22 ohm 10W resistor.**

**We recommend in case of any malfunction to send the power box to Wiener or to one of our representative for service**

**The backplane is connected to 385 V DC voltage. So never touch the backplane or its connectors!**

**The HV-Modules produce very high voltage which may be mortal danger if handled improperly. Please read the separate manuals of the HV modules for detailed information!**

## **Declaration of Conformity**

Low Voltage Directive 73/23/EEC and EMC Directive Art. 10.1 of 89/336/EEC

---

**Conditions:**

This unit is not a final product and is foreseen for use inside a closed cabinet. The supplying of loads over long distances (>3m) needs possibly additional RF rejection hardware to get in conformity of the definition.

# 1 General Information

MPOD LX crate with mixed low and high voltage modules

## 1.1 MPOD Features

MPOD is a mainframe for multi-channel high voltage (HV) power supply modules. A unique flexibility is given by outfitting the MPOD crate with HV backplane only. The full size MPOD crate has 10 slots for power modules which provides a high number of output channels. Its modular design makes the customer able to easily replace the fan tray, the controller, the primary power supply or the optional air filter.

- 10 module slots for up to 320 HV channels
- 8U high for bottom cooling air intake, optional as desktop or front / side intake with dust filter
- Modules and controller outputs can be placed either at front or rear side (picture above shows front side)
- HV: 320/240/160/80 channels (0- 2,5/4/6kV/8kV), channel- or module wise floating or common ground
- Low noise and ripple
- Individually controlled output channels (voltage and current), programmable warning and trip levels
- MPOD Controller with Ethernet (TCP/IP) / CANbus / USB Combi-interface, Interlock
- Ethernet port with integrated Web server, programmable with SNMP protocol via TCP/IP, OPC Server
- CE conform EN 50 081/82 part 1 (EN 50 022 B)
- safety in accordance with EN 60 950
- Sinusoidal mains current EN 61000-3-2

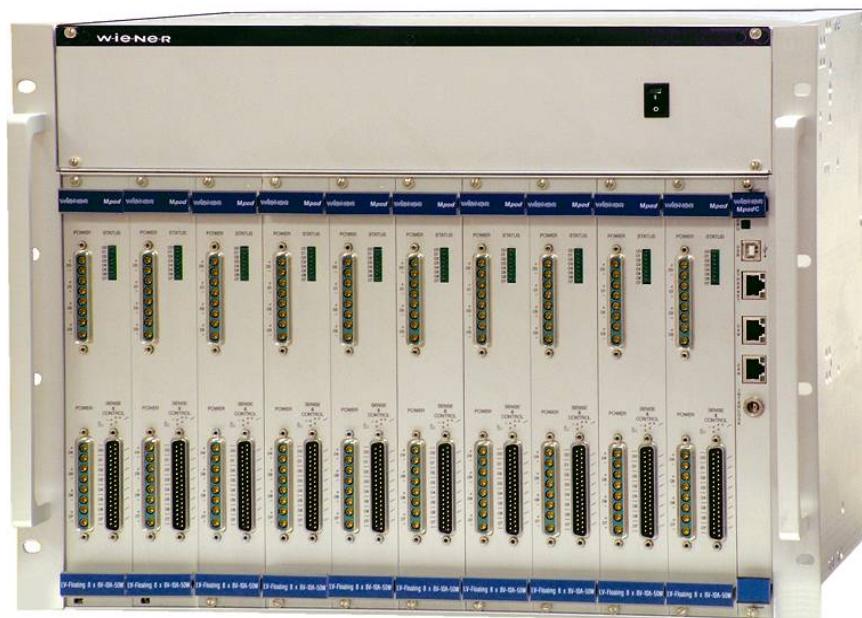

## 1.2 MPOD Crate - standard types

The following crate types are standardized configurations with 8U high chassis. Optionally a filter frame is available with bottom or front air inlet which increases the height to 9U.

Other configurations and mixed system with part of the crate outfitted with PCI or VME backplanes are available on request.

Type	Slots	Remote control interface	Local control / Backplane display	HV power	Output Position
<b>MPOD 2H</b>	10	Ethernet, CAN, USB	-	HV	1200W front
<b>MPOD 2H-R</b>	10	Ethernet, CAN, USB	-	HV	1200W rear
<b>MPOD 2H-LX</b>	10	Ethernet, CAN, USB	Yes, LCD	HV	1200W front
<b>MPOD 2H-LX-R</b>	10	Ethernet, CAN, USB	Yes, LCD	HV	1200W rear

(CAN-bus for HV modules only, disabling Ethernet communication may be necessary for ISEG CAN-HV control software)

MPOD EC-LV crate with low voltage modules

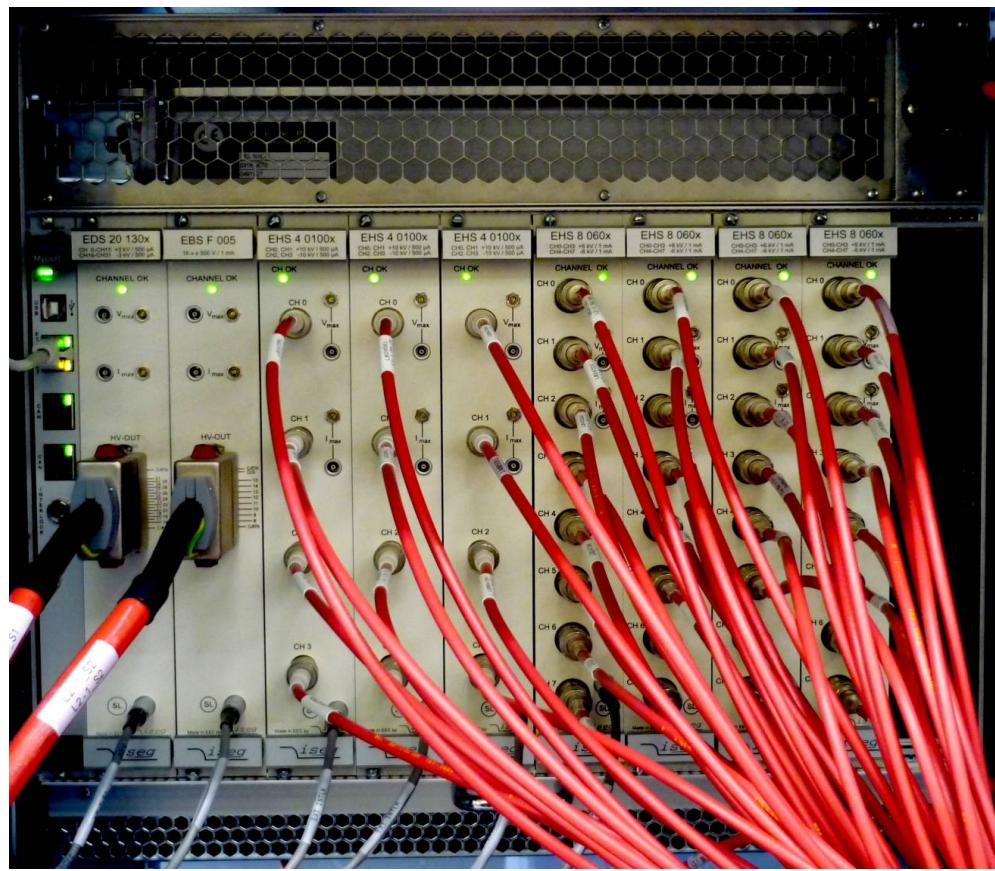

## 2 HV Modules

MPOD high voltage modules are manufactured by ISEG. For technical details please refer to the ISEG manuals and data sheets of the EHS, EBS, EDS and EHQ (discontinued) multi channel high voltage modules. General features are:

- High Voltage modules with 4, 8, 16, 24 or 32 individually controlled channels
- Maximum voltage range from 500V up to 10 kV
- Extremely low noise and ripple: <5mVpp to <10mVpp
- All DC outputs floating or common ground depending on module type
- Voltage and current settings / monitoring for each channel, 16 to 21 bit resolution
- Current monitoring and limiting for each channel, 16 to 21 bit resolution
- Programmable channel parameters, group features
- output connectors:
  - 8 channel modules SHV or REDEL (<4kV) multi pin  
Kings for 8kV and 10kV (4 channels only)
  - 16 channel modules SHV or REDEL (<4kV) multi pin
  - 24 channel modules REDEL (<4kV) multi pin or AMP 201311-3
  - 32 channel modules REDEL multi pin

ISEG high voltage modules with 4 channels KINGS (10kV), 8 and 16 channels SHV, and 8 / 16 channels REDEL multi-pin connectors (from left to right)

MPOD crate with rear side module option and air filter outfitted with ISEG EDS, EBS and EHS high voltage modules and wired safety loop.

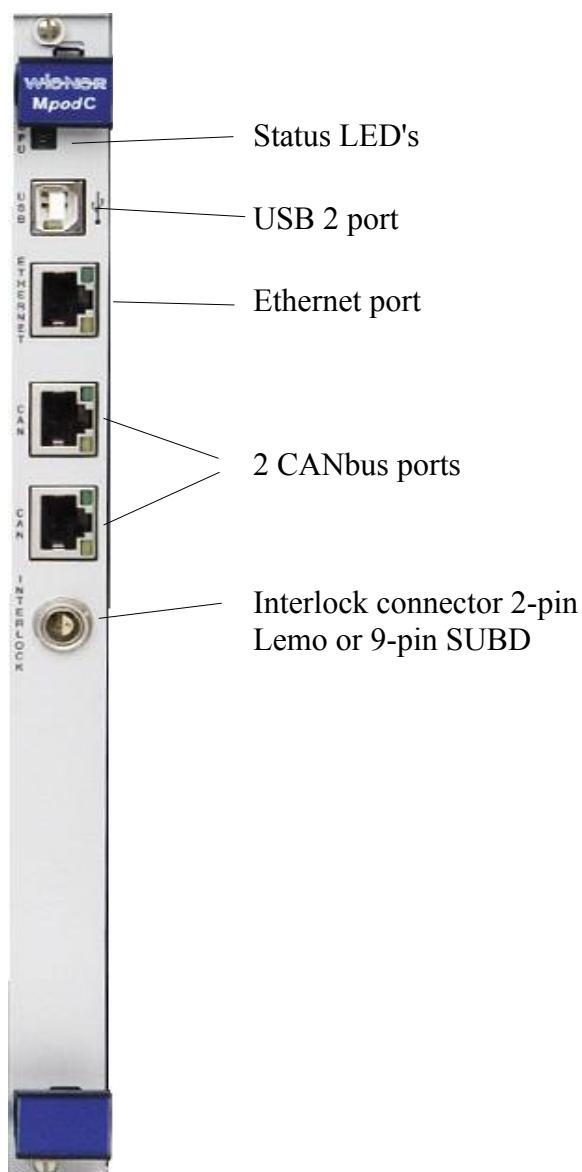

Status LED's for all 8 channels

### 3 MPOD Controller

The MPOD controller which is plugged into the first half slot of the crate controls the primary power supply as well as all inserted HV-modules. Further it connects these to remote controlling interfaces / services in an unique way.

MPOD Controller features:

- TCP/IP 10M/100M port, auto ranging
- Built-in HTTP server
- TCP/IP protocol with SNMP v.2c for full control of all module parameters
- 2 CAN-Bus ports, wired in parallel for daisy-chaining
- USB 2 interface
- 3 status LED's
- Interlock connector

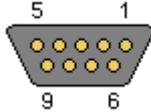

### Ethernet port, standard NIC pin layout

RJ45	Pin	Signal	Comment
	1	TX+	
	2	TX-	
	3	RX+	
	4	GND 1	75 Ohm
	5	GND 1	
	6	RX-	
	7	GND 2	75 Ohm
	8	GND 2	

### CAN-bus ports

RJ45	Pin	Signal	Comment
	1	CAN-H	
	2	CAN-L	
	3	GND	
	4	n.c.	
	5	n.c.	
	6	reserved	
	7	GND	
	8	n.c.	

### Interlock connector

DSUB9 female	Pin	Signal	Comment
	1	CRATE_ENABLE	TTL input (1 kOhm resistor to GND) A high level allows the channels to be switched on by software A low level forces all channels to switch off with their specified down ramp.
	2	CRATE_FAST_OFF	TTL input (1 kOhm resistor to GND) A high level forces all channels to switch off as fast as possible. Any ramp-down settings are ignored.
	3	reserved	
	4	reserved	
	5	GND	Ground reference
	6	CRATE_STATUS	TTL output (1 kOhm resistor to GND, 100 Ohm resistor to protect the output buffer) This signal is driven high, if one or more channels of the MPOD system do have a non-zero output voltage
	7	reserved	
	8	reserved	
	9	reserved	

## 4 Remote Control / Software

Please check the download section at [www.wiener-d.com](http://www.wiener-d.com) for the latest version of MPOD software and documentation!

### 4.1 Software Setup for Microsoft Windows

Before the MPOD Controller can be used, it may have to be configured according to the network environment. The factory default configuration is DHCP (IP address of 0.0.0.0).

This is done locally via display or by running the MUSEcontrol utility, which allows access via the USB-port of the MPOD Controller with a computer running 32-bit Windows XP, VISTA or Windows 7.

Please download the latest version from the download area at [www.wiener-d.com](http://www.wiener-d.com). Run the MUSEControl.msi Program to install all drivers and the USB program itself. It is recommended to define a short path for the driver location during installation. Connecting the MPOD Controller via USB it should be automatically detected and the Silicon Labs USB drivers (SiLib.sys and SiUSBXp.sys) loaded

Starting the program, the main window gives a quick overview of the MPOD and its connected MPV low voltage modules. Please note that the MPOD crate has to be switched off in order to do configurations!

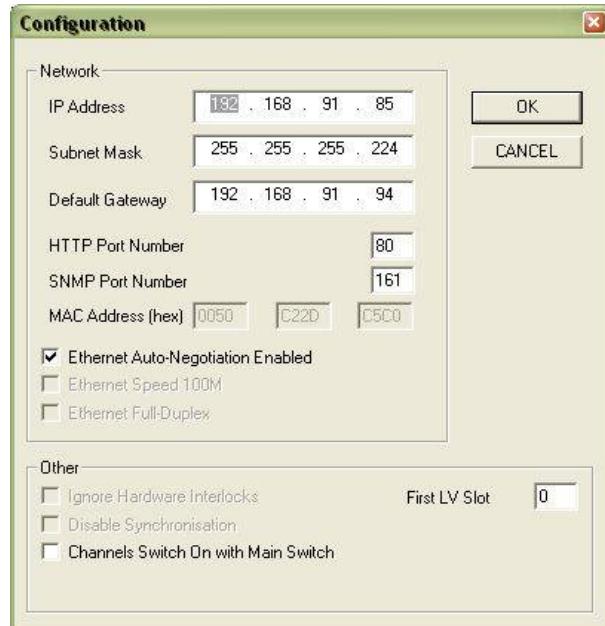

An error message “No module found” will pop up which should be ignored. Note, all ISEG high voltage modules will not be shown and can not be controlled via USB!

To prepare the MPOD controller select System → Configuration which starts the network configuration dialog as shown below. Here you enter the TCP/IP network settings (IP address, subnet mask and default gateway). You have to use the parameters of your local network here. Please contact your network administrator for details. In order to use DHCP (factory default) an IP address of 0.0.0.0 has to be selected.

It is recommended to configure larger systems in one IP address range. For instance a system of 50 MPOD crates should allocate the IP addresses from 192.168.17.101 until 192.168.17.150. The advantage of such a configuration is that many of our programs and script files controls a number of MPOD's beginning with the first IP address until the last IP address.

IP address of 0.0.0.0 will enable DHCP.  
 HTTP and SNMP port numbers should only be modified if you know what you do. Setting any ports to 0 disables the server.

## 4.2 Script files

The default IP base is 192.168.17.xxx defined in the file snmpOptions. Please change these value according to your network configuration.

\$ ./sysDescr

Syntax: ./sysDescr FirstIpAddress [LastIpAddress]

Gets the sysDescription for all crates in the given IP range.

Example: ./sysDescr 101 120

\$ ./moduleDescription

Syntax: ./moduleDescription firstIpAddress [lastIpAddress]

Reads the moduleDescription for all slots

Example: ./moduleDescription 101 120

\$ ./outputVoltage

Syntax: ./outputVoltage voltage firstIpAddress [lastIpAddress]

Sets the outputVoltage for all channels to voltage.

Only the last Byte of the IP address has to be given!

(The base is automatically added)

Example: ./outputVoltage 2500 101 120

\$ ./outputSwitch

Syntax: ./outputSwitch { 0 | 1 | 2 | 3 | 10 } firstIpAddress [lastIpAddress]

Sets the outputSwitch for all channels to 0(off), 1(on),

2(setEmergency), 3(resetEmergency) or (10)clearEvents.

Only the last Byte of the IP address has to be given!

(The base is automatically added)

Example: ./outputSwitch 1 101 120

\$ ./outputStatus

Syntax: ./outputStatus firstIpAddress [lastIpAddress]

Read the outputStatus for all channels.

Only the last Byte of the IP address has to be given!

(The base is automatically added)

Example: ./outputStatus 101 120.

```
$ ./outputMeasurementTerminalVoltage
```

```
Syntax: ./outputMeasurementTerminalVoltage firstIpAddress [lastIpAddress]
```

Read the outputMeasurementVoltage for all channels.

Only the last Byte of the IP address has to be given!

(The base is automatically added)

```
Example: ./outputMeasurementTerminalVoltage 101 120
```

### 4.3 Web Browser

With a web browser pointing to the IP address as URL it is possible to get an overview of all channels (read only) in a simple way.

Global Status						
Mainframe Status				ON		
Output Channels						
Channel	Voltage	Current	Measured Sense Voltage	Measured Current	Measured Terminal Voltage	Status
U 4	3000.0 mV	5000.0 mA	2999.5 mV	-5127.0 uA	3164.6 mV	ON
U 5	4000.0 mV	5000.0 mA	3999.0 mV	-3906.3 uA	4218.8 mV	ON
U 6	5000.0 mV	5000.0 mA	5001.5 mV	8.545 mA	5273.9 mV	ON
U 7	6000.0 mV	5000.0 mA	5999.0 mV	-5371.1 uA	6330.1 mV	ON
U500	101.00 V	6000.0 uA	100.98 V	0 A	100.98 V	ON
U501	152.00 V	6000.0 uA	151.99 V	0 A	151.99 V	ON
U502	103.00 V	6000.0 uA	103.05 V	0.0 uA	103.05 V	ON
U503	154.00 V	6000.0 uA	154.03 V	0 A	154.03 V	ON
U504	105.00 V	6000.0 uA	104.61 V	0 A	104.61 V	ON
U505	156.00 V	6000.0 uA	155.78 V	0.1 uA	155.78 V	ON
U506	107.00 V	6000.0 uA	106.97 V	0 A	106.97 V	ON
U507	152.00 V	6000.0 uA	152.14 V	0 A	152.14 V	ON
U508	0 V	6000.0 uA	0 V	0 A	0 V	OFF
U509	0 V	6000.0 uA	0 V	0 A	0 V	OFF
U510	0 V	6000.0 uA	0 V	0 A	0 V	OFF
U511	0 V	6000.0 uA	0 V	0 A	0 V	OFF
U512	0 V	6000.0 uA	193.20 mV	0 A	193.20 mV	OFF
U513	0 V	6000.0 uA	0 V	0 A	0 V	OFF
U514	0 V	6000.0 uA	0 V	0 A	0 V	OFF
U515	0 V	6000.0 uA	0 V	0 A	0 V	OFF

#### 4.4 NetSNMP

NetSNMP is an open source SNMP program which can be used to access the MPOD controller via the **Simple Network Management Protocol**.

Please see <http://net-snmp.sourceforge.net/> for more details.

Please install netSNMP from the CD-ROM or downloaded from WIENER support web site on the control computer. In order to perform SNMP calls from any WIENER product the WIENER-CRATE-MIB file must be stored somewhere on the PC doing the calls, by default that location should be /usr/share/snmp/mibs (Windows: C:\usr\share\snmp\mibs).

The most commonly used net-snmp calls are:

**snmpwalk** – returns groups of parameters / items  
**snmpget** – returns a specific parameter (read)  
**snmpset** – sets a specific parameter (write)

Please see the Net-snmp description and help files for detailed instructions and options. All parameters defined for the WIENER MPOD system as well as crates and other power supplies are contained within the WIENER-CRATE-MIB.txt file.

A fast and easy way to begin using SNMP is to use command line arguments. The command line arguments specified in this document are based on netSNMP. The command line syntax is the same for both windows and Linux (and probably MAC OSX).

For all WIENER-CRATE-MIB library calls a quick help text can be shown by using

**snmptranslate -On -Td WIENER-CRATE-MIB::xxxx**

```
snmptranslate -On -Td WIENER-CRATE-MIB::outputName
.1.3.6.1.4.1.19947.1.3.2.1.2
outputName OBJECT-TYPE
-- FROM      WIENER-CRATE-MIB
-- TEXTUAL CONVENTION DisplayString
SYNTAX      OCTET STRING (1..4)
DISPLAY-HINT "255a"
MAX-ACCESS  read-only
STATUS      current
DESCRIPTION "A textual string containing a short name of the
              output. If the crate is equipped with an alphanumeric
              display, this string is shown to identify a output channel."
 ::= { iso(1) org(3) dod(6) internet(1) private(4) enterprises(1)
        wiener(19947) c
        rate(1) output(3) outputTable(2) outputEntry(1) 2 }
```

A first communication with the MPOD crate can be done using the snmpwalk to confirm the existence of the power supply at the given IP address.

**snmpwalk -Cp -Oqv -v 2c -M \$path -m +WIENER-CRATE-MIB -c public \$ip**

with:

**snmpwalk:** This command will retrieve a block of information.

**-v 2c:** This parameter specifies which version of the SNMP to use. WIENER devices use SNMP 2C.

**-M \$path:** This parameter should be replaced with the path to the WIENER-CRATE-MIB.txt file. It is not needed in case the default path is used.

**-m +WIENER-CRATE-MIB:** This parameter tells the command to look at the WIENER-CRATE-MIB to resolve the OID name.

**-c public:** This specifies which community of values can be accessed.

**\$ip:** This should be replaced with the IP address of the MPOD crate.

Example for crate with IP address 192.168.2.25:

**snmpwalk -v 2c -m +WIENER-CRATE-MIB -c public 192.168.2.25**

returns:

*SNMPv2-MIB::sysDescr.0 = STRING: WIENER MPOD (4193086, MPOD 1.1.1.6, MPODslave 1.06)*

*SNMPv2-MIB::sysObjectID.0 = OID: WIENER-CRATE-MIB::sysMainSwitch.0*

*SNMPv2-MIB::sysUpTime.0 = Timeticks: (13401) 0:02:14.01*

*SNMPv2-MIB::sysContact.0 = STRING:*

*SNMPv2-MIB::sysName.0 = STRING:*

*SNMPv2-MIB::sysLocation.0 = STRING:*

*SNMPv2-MIB::sysServices.0 = INTEGER: 79*

A list of all available parameters or sub-parameters as for instance channels can be obtained using the command snmpwalk with the parameter “crate”. To get all parameters use:

**snmpwalk -Cp -Oqv -v 2c -M \$path -m +WIENER-CRATE-MIB -c public \$ip crate**

example:

**snmpwalk -v 2c -m +WIENER-CRATE-MIB -c public 192.168.2.25 crate**

Further it is possible obtain the array of names or values for a specific parameter. The following command provides a list of all existing output channels:

**snmpwalk -Cp -Oqv -v 2c -M \$path -m +WIENER-CRATE-MIB -c public \$ip  
outputName**

Example:

```
snmpwalk -v 2c -m +WIENER-CRATE-MIB -c public 192.168.2.25 outputName
```

returns for MPOD system with 2 ISEG EHS HV modules (8 channels each) in slot 2 and 3:

```
WIENER-CRATE-MIB::outputName.u100 = STRING: U100
WIENER-CRATE-MIB::outputName.u101 = STRING: U101
WIENER-CRATE-MIB::outputName.u102 = STRING: U102
WIENER-CRATE-MIB::outputName.u103 = STRING: U103
WIENER-CRATE-MIB::outputName.u104 = STRING: U104
WIENER-CRATE-MIB::outputName.u105 = STRING: U105
WIENER-CRATE-MIB::outputName.u106 = STRING: U106
WIENER-CRATE-MIB::outputName.u107 = STRING: U107
WIENER-CRATE-MIB::outputName.u200 = STRING: U200
WIENER-CRATE-MIB::outputName.u201 = STRING: U201
WIENER-CRATE-MIB::outputName.u202 = STRING: U202
WIENER-CRATE-MIB::outputName.u203 = STRING: U203
WIENER-CRATE-MIB::outputName.u204 = STRING: U204
WIENER-CRATE-MIB::outputName.u205 = STRING: U205
WIENER-CRATE-MIB::outputName.u206 = STRING: U206
WIENER-CRATE-MIB::outputName.u207 = STRING: U207
```

This example returns 16 index numbers. Please note the following geographic module and channel number coding for the SNMP call indexes, where the first digit is defined by the slot number and the following two by the channel of the particular module in this slot:

Slot	Channel	Name	index
1	0 to 99	Uxx	.u00 to .u99
2	0 to 99	U1xx	.u100 to .u199
...	...	...	...
10	0 to 99	U9xx	.u901 to .u999

Please note that both the index as well as the name can be used!

```
snmpget -v 2c -m +WIENER-CRATE-MIB -c public 192.168.0.80 outputVoltage.u0
WIENER-CRATE-MIB::outputVoltage.u0 = Opaque: Float: 123.000000 V
```

is identical to

```
snmpget -v 2c -m +WIENER-CRATE-MIB -c public 192.168.0.80 outputVoltage.1
WIENER-CRATE-MIB::outputVoltage.u0 = Opaque: Float: 123.000000 V
```

In case of multi crate system there will be an additional digit for the crate number:

```
Name = 1000 * crate + 100*slot + channel
index = 1000 * crate + 100*slot + channel
```

(crate: 0 .... 9, slot: 0 ... 9 , channel: 0 ... 99)

To see all output channel set voltage values use snmpwalk with outputVoltage:

```
snmpwalk -Cp -Oqv -v 2c -M $path -m +WIENER-CRATE-MIB -c public $ip
outputVoltage
```

Example:

```
snmpwalk -v 2c -m +WIENER-CRATE-MIB -c public 192.168.2.25 outputVoltage
```

returns for a MPOD system with one 8 channel ISEG EHS HV module in slot 3:

```
WIENER-CRATE-MIB::outputVoltage.u200 = Opaque: Float: 0.000000 V
```

```
WIENER-CRATE-MIB::outputVoltage.u201 = Opaque: Float: 0.000000 V
```

```
WIENER-CRATE-MIB::outputVoltage.u202 = Opaque: Float: 0.000000 V
```

```
WIENER-CRATE-MIB::outputVoltage.u203 = Opaque: Float: 0.000000 V
```

```
WIENER-CRATE-MIB::outputVoltage.u204 = Opaque: Float: 0.000000 V
```

```
WIENER-CRATE-MIB::outputVoltage.u205 = Opaque: Float: 0.000000 V
```

```
WIENER-CRATE-MIB::outputVoltage.u206 = Opaque: Float: 0.000000 V
```

```
WIENER-CRATE-MIB::outputVoltage.u207 = Opaque: Float: 0.000000 V
```

After obtaining information about the power supplies or a list of channels and parameters, it is useful to be able to write or read information about it. This can be done using the **snmpget** and **snmpset** commands.

```
snmpget -Oqv -v 2c -M $path -m +WIENER-CRATE-MIB -c guru $ip name.index
```

```
snmpset -v 2c -M $path -m +WIENER-CRATE-MIB -c guru $ip name.index format  
value
```

The most common kind of call you will want is to get data from the power supply. This is easily done via the **snmpget** command. The example below retrieves information about whether the main power for the crate is on. If you wish to test this example on your own system replace “\$path” with the path to WIENER-CRATE-MIB.txt (/usr/share/snmp/mibs by default and “\$ip” with the ip address of your MPOD (see following examples).

```
snmpget -v 2c -M $path -m +WIENER-CRATE-MIB -c public $ip sysMainSwitch.0  
WIENER-CRATE-MIB::sysMainSwitch.0 = INTEGER: OFF(0)
```

This indicates that the MPOD crate is currently off. To better understand the call above we will break it down by parameter:

**snmpget:** This command will retrieve a value about the MPOD crate or one of the channels it houses..

**-v 2c:** This parameter specifies which version of the SNMP to use. WIENER devices use SNMP 2C.

**-M \$path:** This parameter should be replaced with the path to the WIENER-CRATE-MIB.txt file.

**-m +WIENER-CRATE-MIB:** This parameter tells the command to look at the WIENER-CRATE-MIB to resolve the OID name.

**-c public:** This specifies which community of values can be accessed.

**\$ip:** This should be replaced with the IP address of the MPOD crate.

**sysMainSwitch.0:**

This is the register you wish to retrieve.

Since we know from the call above that the crate is off, we may want to turn it on. (Software power cycling is only possible if the green mains switch on the MPOD is “ON”, this is to prevent a remote user to override a local user and adds a level of safety to the unit.) To turn MPOD on, we can use the command:

```
snmpset -v 2c -path -m +WIENER-CRATE-MIB -c public $ip sysMainSwitch.0 i 1
```

Most of the parameters for snmpset are the same as snmpget, the new parameters are highlighted below.

**i:** Since sysMainSwitch.0 is an integer value, we specify the value to be an integer with.

**1:** This is the value we wish to write. In this case we write ‘one’ to set the main switch to on.

For most of the write commands (snmpset) the access type has to be changed from public to guru.

A complete list of value names that can be written or read via SNMP can be found in the WIENER-CRATE-MIB but commonly needed values are:

Value Name	Type	Access	Comments
<b>outputVoltage</b>	Float	R/W	The Channel set Voltage
<b>outputCurrent</b>	Float	R/W	The channel current limit
<b>outputMeasurementSenseVoltage</b>	Float	R	Actual channel Voltage
<b>outputMeasurementCurrent</b>	Float	R	Actual channel current
<b>outputSwitch</b>	Integer	R/W	Turns channel ON / OFF, emergency off, reset error flags
<b>outputVoltageRiseRate</b>	Float	R/W	Channel ramp rate
<b>outputStatus</b>	Bits	R	Channel Status information

For example, to set a channel set voltage use:

```
snmpset -Oqv -v 2c -M $path -m +WIENER-CRATE-MIB -c guru $ip  
outputVoltage.index F 200.5
```

Example:

```
snmpget -v 2c -m +WIENER-CRATE-MIB -c public 192.168.2.25 outputVoltage.u0  
WIENER-CRATE-MIB::outputVoltage.u0 = Opaque: Float: 0.000000 V
```

Write and read individual set voltages, “guru” access needed to write!

```
snmpset -v 2c -m +WIENER-CRATE-MIB -c guru 192.168.2.25  
outputVoltage.u101 F 200  
WIENER-CRATE-MIB::outputVoltage.u101 = Opaque: Float: 200.000000 V
```

Note the “F” before the 200, this indicates that the value is a floating point number. This value can be read back via:

```
snmpget -v 2c -m +WIENER-CRATE-MIB -c public 192.168.2.25  
outputVoltage.u101  
WIENER-CRATE-MIB::outputVoltage.u101 = Opaque: Float: 200.000000 V
```

Turning Channels ON/OFF - The individual channels of an MPOD system low or high voltage module can be turned on or off using the snmpset command. To turn on channel Ux:

```
snmpset -Oqv -v 2c -M $path -m +WIENER-CRATE-MIB -c guru $ip  
outputSwitch.index i 1
```

The same channel can be turned off with:

```
snmpset -Oqv -v 2c -M $path -m +WIENER-CRATE-MIB -c guru $ip  
outputSwitch.index i 0
```

Example:

```
snmpset -v 2c -m +WIENER-CRATE-MIB -c guru 192.168.2.25 outputSwitch.u101  
i 1
```

The outputSwitch can also be used for emergency-off and to reset error flags. The matching values are: {off(0), on(1), resetEmergencyOff(2), setEmergencyOff(3), clearEvents(10)}

MPOD low and high voltage modules have programmable voltage ramp speeds. The WIENER low voltage modules allow different ramp up and down values for each channel whereas for ISEG modules with common ramp the channel-ID can be any channel of the module! For write access “guru” is needed:

```
snmpset -Oqv -v 2c -M $path -m +WIENER-CRATE-MIB -c guru $ip  
outputVoltageRiseRate.index F value
```

Example:

```
snmpset -v 2c -m +WIENER-CRATE-MIB -c guru 192.168.2.25  
outputVoltageRiseRate.u101 F 10  
WIENER-CRATE-MIB::outputVoltageRiseRate.u101 = Opaque: Float: 10.000000 V/s
```

```
snmpget -v 2c -m +WIENER-CRATE-MIB -c public 192.168.2.25  
outputVoltageRiseRate.u101  
WIENER-CRATE-MIB::outputVoltageRiseRate.u101 = Opaque: Float: 10.000000 V/s
```

To access multiple units the groupsSwitch function provides access to all modules in the MPOD crate (index 0), all ISEG HV modules (index 64), or to all WIENER low voltage modules (index 128). In addition groups can be defined for low voltage modules.

Item	Type	Access	Switch functions
<b>groupsSwitch</b>	integer	write	Off (0), On (1), resetEmergencyOff (2), setEmergencyOff (3), disableKill (4), enableKill (5), clearEvents (10)

Examples:

switch all channels of all modules on:

```
snmpset -v 2c -m +WIENER-CRATE-MIB -c guru 192.168.0.80 groupsSwitch.0 i 1  
WIENER-CRATE-MIB::groupsSwitch.0 = INTEGER: on(1)
```

switch all channels off:

```
snmpset -v 2c -m +WIENER-CRATE-MIB -c guru 192.168.0.80 groupsSwitch.0 i 0  
WIENER-CRATE-MIB::groupsSwitch.0 = INTEGER: off(0)
```

switch all high voltage channels (iseg modules) off:  
**snmpset -v 2c -m +WIENER-CRATE-MIB -c guru 192.168.0.80**  
**groupsSwitch.64 i 0**  
**WIENER-CRATE-MIB::groupsSwitch.64 = INTEGER: off(0)**

RESET ISEG HV Modules after Safetyloop error:  
**snmpset -v 2c -m +WIENER-CRATE-MIB -c guru 192.168.0.80**  
**groupsSwitch.64 i 10**  
**WIENER-CRATE-MIB::groupsSwitch.64 = INTEGER: clearEvents(10)**

## 4.5 ISEG High voltage module special commands

Item	Type	Access	Unit	Range
<b>outputVoltageRiseRate</b>	<b>float</b>	<b>read-write</b>	<b>[V/s]</b>	<b>2V/s - 20% Vnom 1% (KILL enabled)</b>

ISEG high voltage modules have one common value for ramping up and down for all channels. This value can be set or read by using any channel number of the particular module as index. For ISEG high voltage modules with 2 PCB's each of the sub-grups of one PCB may have one ramp value. In this case one should set the ramp twice by using a low and high channel number. ISEG EHQ, EHS, EDS and EBS modules typically have a ramp rate range from 1V/s .... 20% of Vnom (max. nominal voltage). In case KILL is enabled the maximum ramp rate is reduced to 1% in order to lower the risk of unwanted trips during voltage ramp cycles.

**snmpset -Oqv -v 2c -M \$path -m +WIENER-CRATE-MIB -c guru \$ip**  
**outputVoltageRiseRate.index F value**

Item	Type	Access	Unit	Range
<b>outputCurrentRiseRate</b>	<b>float</b>	<b>read-write</b>	<b>[A/s]</b>	<b>2 - 100% nom. Val.</b>
<b>outputCurrentFallRate</b>	<b>float</b>	<b>read-write</b>	<b>[A/s]</b>	<b>2 - 100% nom. Val.</b>

### DESCRIPTION

The **outputCurrentRiseRate** and **outputCurrentFallRate** accesses one data point of the HV modules and therefore will be reply always the same value.

**outputTripTimeMaxCurrent integer**      **read-write**      **[ms]**      **16 – 4000 ms**

### DESCRIPTION

The outputTripTimeMaxCurrent defines a span for the time out function. The activity is depending of the programmed bit field outputFailureMaxCurrent of the item outputSupervisionBehavior. A write value of **0** is switching off the delayed trip function which was defined in the bit field outputFailureMaxCurrent of outputSupervisionBehavior before.

Item	Type	Access	Status bits / Switch functions
<b>outputStatus</b>	<b>bits</b>	<b>read</b>	<b>outputEnableKill (13) outputEmergencyOff (14)</b>
<b>outputSwitch</b>	<b>integer</b>	<b>read-write</b>	<b>Off (0), On (1), resetEmergencyOff (2), setEmergencyOff (3), clearEvents (10)</b>

### DESCRIPTION

Read: An enumerated value which shows the current state of the output channel.  
Write: Change the state of the channel.

If the channel is On, and the write value is **Off**, then the channel will switch off.  
If the channel is Off, and the write value is **On**, and if no other signals (mainInhibit, outputInhibit, outputEmergencyOff or outputFailureMaxCurrent) are active, then the channel will switch on.

If the write value is **resetEmergencyOff**, then the channel will leave the state EmergencyOff.

A write of **clearEvents** is necessary before the voltage can ramp up again.

If the write value is **setEmergencyOff**, then the channel will have the state EmergencyOff, which means that the High Voltage will switch off without a ramp and reset of the outputVoltage to null volt.

If the write value is **clearEvents**, then all failure messages of the outputStatus will be reset (all channel events and the state EmergencyOff).

Item	Type	Access	Switch functions
<b>groupsSwitch.64</b>	<b>integer</b>	<b>write</b>	<b>Off (0), On (1), resetEmergencyOff (2), setEmergencyOff (3), disableKill (4), enableKill (5), clearEvents (10)</b>

#### DESCRIPTION

Read: This function is not defined with groups of output channels.

Write: Switch the state of all channels of group 64 (all high voltage modules).

If any channel is On, and the write value is **Off**, then all channels will switch off. If any channel is Off, and the write value is **On**, and if no other signals (mainInhibit, outputInhibit, outputEmergencyOff or outputFailureMaxCurrent) are active, then all channels will switch on.

If the write value is **resetEmergencyOff**, then all channels will leave the state EmergencyOff.

A write of **clearEvents** is necessary before the voltage can ramp up again.

If the write value is **setEmergencyOff**, then all channels will have the state EmergencyOff, which means that the High Voltage will switch off without a ramp and reset of the outputVoltage to null volt.

If the write value is **disableKill**, then all channels will switch to disableKill.

If the write value is **enableKill**, then all channels will switch to enableKill.

If the write value is **clearEvents**, then all failure messages of the outputStatus will be reset (all channel events, all module events and the state EmergencyOff).

Item	Type	Access
<b>outputSupervisionBehavior</b>	<b>integer</b>	<b>read-write</b>
<b>DESCRIPTION</b>		
A bit field packed into an integer which define the behavior of the output channel / power supply after failures.		

For each supervision value, a two-bit field exists. The enumeration of this value (..L+..H\*2) is:

WIENER LV devices

0 ignore the failure

1 switch off this channel

2 switch off all channels with the same group number

3 switch off the complete crate.

iseg HV devices

0 ignore the failure

1 switch off this channel by ramp down the voltage

2 switch off this channel by set a internal EmergencyOff

3 switch off the whole board of the HV module by set EmergencyOff.

The position of the bit fields in the integer value are:

Bit 0, 1: **outputFailureMinSenseVoltage**

Bit 2, 3: **outputFailureMaxSenseVoltage**

Bit 4, 5: **outputFailureMaxTerminalVoltage**

Bit 6, 7: **outputFailureMaxCurrent**

Bit 8, 9: **outputFailureMaxTemperature**

Bit 10, 11: **outputFailureMaxPower**

Bit 12, 13: **outputFailureInhibit**

Bit 14, 15: **outputFailureTimeout**

The iseg HV devices can use the bit fields:

<b>outputFailureMaxCurrent</b>	support of the function delayed trip The programmed activity will start when the actual current exceeded permanently the value of the item outputCurrent over the span of the programmed time out (set via the item <b>outputTripTimeMaxCurrent</b> ).
--------------------------------	---

<b>outputFailureInhibit</b>	support of the optional hardware function EXTERNAL INHIBIT per channel The programmed activity will start when an external channel inhibit occurs
-----------------------------	--

The channel state have to be in disableKill for a proper work of the configuration of the behavior for the functions above.

**Settings for outputSupervisionBehavior:**

Action	outputFailureMaxCurrent	outputFailureInhibit
ignore the failure	0	0
switch off this channel by ramp down the voltage	64	4096
switch off this channel by set a internal EmergencyOff	128	8192
switch off the whole board of the HV module by set EmergencyOff	192	12288

**Attention:** In order to use delayed software trips please make sure to have a firmware on the ISEG high voltage modules which supports this feature. Please see the following table of supported firmware releases. In case of older firmware the software trip will not act, i.e. the error will be detected but no action (ram down of channel) will happen.

Name of firmware	Release	Date	Description	Device class
E24D1	01.05.21	02.22.13	EDS 24/48 channel distributor module,	21
E16D0	4.25	05/08/09	EDS 16/32 channel distributor module, with Vmax from $V_{O \text{ max}}$ to $(V_{O \text{ max}} - 1\text{kV})$	21
E16D1	4.25	05/08/09	EDS 16/32 distributor module	21
E08C0	2.22	02/23/09	EHS 4/8/16 channel, common GND module	24
E08F0	2.27	12/18/08	EHS 4/8/16 channel, floating GND module	25
E08F2	4.06	06/23/09	EHS 4/8/16 channel, floating GND module, 2 ranges for measurement of current	26
E08B0	1.02	07/10/09	EBS 8/16 bipolar channels, distributor module	28

Example of necessary SNMP commands for the delayed trip function:

**snmpset -Oqv -v 2c -m +WIENER-CRATE-MIB -c guru 192.168.2.25**

**groupsSwitch.64 i 4**

WIENER-CRATE-MIB::groupsSwitch.64 = INTEGER: disableKill(4)

**snmpset -Oqv -v 2c -m +WIENER-CRATE-MIB -c guru 192.168.2.25**

**outputVoltage.u100 F 60**

WIENER-CRATE-MIB::outputVoltage.u100 = FLOAT: 60.000000 V

**snmpset -Oqv -v 2c -m +WIENER-CRATE-MIB -c guru 192.168.2.25**

**outputSwitch.u100 i 1**

WIENER-CRATE-MIB::outputSwitch.u100 = INTEGER: On(1)

**snmpget -Oqv -v 2c -m +WIENER-CRATE-MIB -c public 192.168.2.25**

**outputVoltage.u100**

WIENER-CRATE-MIB::outputVoltage.u100 = FLOAT: 60.000000 V

**snmpget -Oqv -v 2c -m +WIENER-CRATE-MIB -c public 192.168.2.25**

**outputMeasurementTerminalVoltage.u100**

WIENER-CRATE-MIB::outputMeasurementTerminalVoltage.u100 = FLOAT: 60.104 V

```

snmpget -Oqv -v 2c -m +WIENER-CRATE-MIB -c public 192.168.2.25
outputMeasurementCurrent.u100
WIENER-CRATE-MIB::outputMeasurementCurrent.u100 = FLOAT: 0.000001 A
snmpgetx -Oqv -v 2c -m +WIENER-CRATE-MIB -c public 192.168.2.25
outputMeasurementCurrent.u100
WIENER-CRATE-MIB::outputMeasurementCurrent.u100 = FLOAT: 0.000000735 A
snmpget -Oqv -v 2c -m +WIENER-CRATE-MIB -c public 192.168.2.25
outputSupervisionBehavior.u100
WIENER-CRATE-MIB::outputSupervisionBehavior.u100 = INTEGER: 0
snmpset -Oqv -v 2c -m +WIENER-CRATE-MIB -c guru 192.168.2.25

WIENER-CRATE-MIB::outputStatus.u100 = INTEGER: On
snmpget -Oqv -v 2c -m +WIENER-CRATE-MIB -c public 192.168.2.25
outputStatus.u100
WIENER-CRATE-MIB::outputStatus.u100 = INTEGER: 80 10
/* outputOn, outputRampUp */
/* a load has been switched on channel 0 to bring them in state CC constant current limited */
snmpget -Oqv -v 2c -m +WIENER-CRATE-MIB -c public 192.168.2.25
outputStatus.u100
WIENER-CRATE-MIB::outputStatus.u100 = INTEGER: 80 20
/* outputOn, outputCurrentLimited */
/* the delayed trip fuction ramps the voltage after 3 seconds to zero */
snmpget -Oqv -v 2c -m +WIENER-CRATE-MIB -c public 192.168.2.25
outputStatus.u100
WIENER-CRATE-MIB::outputStatus.u100 = INTEGER: 04 08
/* outputFailureMaxCurrent, outputRampDown */

```

## 4.6 ISEG Load unit module commands

Item	Type	Access	Unit
<b>outputMeasurementTerminalVoltage</b>	float	read	[V]
<b>outputMeasurementCurrent</b>	float	read	[A]

### DESCRIPTION

The items **outputMeasurementTerminalVoltage** and **outputMeasurementCurrent** return the voltage and current measured internally by the load unit. These values are only measured if the external measurement and ripple measurement are turned off.

Item	Type	Access	Switch functions
<b>outputSwitch</b>	integer	read-write	<b>clearEvents (10)</b>
			<b>setExternalAndRippleMeasurementOff (20)</b>
			<b>setExternalMeasurementOn (21)</b>
			<b>setRippleMeasurementOn (22)</b>
			<b>setExternalAndRippleMeasurementOn (23)</b>

### DESCRIPTION

The item **outputSwitch** allows to activate or deactivate external measurements for a channel via the measurement outputs on the front panel of the load unit.

The value **setExternalMeasurementOn** activates the voltage and current measurement outputs for the channel.

The value **setRippleMeasurementOn** activates the ripple measurement output for the channel.

The value **setExternalAndRippleMeasurementOn** activates all three measurement outputs for the channel.

The value **setExternalAndRippleMeasurementOn** deactivates all measurement outputs for the channel.

Note the measurement output can only be activated for one channel at the same time, i.e. if an output is activated for another channel the previously switched channel is deactivated.

If an external measurement output is activated no internal measurement will be executed. In order to reactivate the internal measurement, the external measurement must be completely deactivated. (If the current output status is unknown this can be done by writing **setExternalAndRippleMeasurementOn** and then **setExternalAndRippleMeasurementOff** for an arbitrary channel.)

All other SNMP items from the branch **outputTable** are readable for the SNMP compatibility but will not be used by the load unit.

## 4.7 Module commands

Item	Type	Access
<b>moduleDescription</b>	octet string	read

Reply:

*company name, firmware name, channel number, serial number*  
for instance *iseg, E24D1, 24, 713100, 5.03*

Item	Type	Access
<b>moduleAuxiliaryMeasurementVoltage0</b>	<b>float</b>	<b>read</b>

Returns the measurement value of the line supply 24 Volt.

<b>moduleAuxiliaryMeasurementVoltage1</b>	<b>float</b>	<b>read</b>
---	--------------	-------------

Returns the measurement value of the line supply 5 Volt.

## 4.8 Change of community names / setting of passwords

For the communication with MPOD modules 4 types of SNMP communities are used, "public", "private", "admin" and "guru". By default the community names are equal to the community types.

```
snmpwalk -v 2c -m +WIENER-CRATE-MIB -c guru 192.168.0.80
```

```
snmpCommunityName
```

```
WIENER-CRATE-MIB::snmpCommunityName.public = STRING: "public"
```

```
WIENER-CRATE-MIB::snmpCommunityName.private = STRING: "private"
```

```
WIENER-CRATE-MIB::snmpCommunityName.admin = STRING: "admin"
```

```
WIENER-CRATE-MIB::snmpCommunityName.guru = STRING: "guru"
```

```
snmpwalk -v 2c -m +WIENER-CRATE-MIB -c private 192.168.0.80
```

```
snmpCommunityName
```

```
WIENER-CRATE-MIB::snmpCommunityName.public = STRING: "public"
```

```
WIENER-CRATE-MIB::snmpCommunityName.private = STRING: "private"
```

In order to secure the MPOD system communication the community names can be used as passwords and be changed accordingly. The following example shows how the change and test the community names. Using a wrong community name will result in a time out error. Please note, that especially the communities with write access (private, admin, guru) should be protected.

```
snmpset -v 2c -m +WIENER-CRATE-MIB -c guru 192.168.0.80
```

```
snmpCommunityName.guru s seCrET
```

```
WIENER-CRATE-MIB::snmpCommunityName.guru = STRING: "seCrET"
```

```
snmpwalk -v 2c -m +WIENER-CRATE-MIB -c guru 192.168.0.80
```

```
snmpCommunityName
```

*Timeout: No Response from 192.168.0.80*

```
snmpwalk -v 2c -m +WIENER-CRATE-MIB -c seCrET 192.168.0.80
```

```
snmpCommunityName
```

```
WIENER-CRATE-MIB::snmpCommunityName.public = STRING: "public"
```

```
WIENER-CRATE-MIB::snmpCommunityName.private = STRING: "private"
```

```
WIENER-CRATE-MIB::snmpCommunityName.admin = STRING: "admin"
```

```
WIENER-CRATE-MIB::snmpCommunityName.guru = STRING: "seCrET"
```

## 4.9 MIB Browser

There are several commercial or open source MIB-Browser programs available which can be used for SNMP communication. These provide often a simple GUI and allow SNMP calls. Following is a list of some free or open source MIB – browsers:

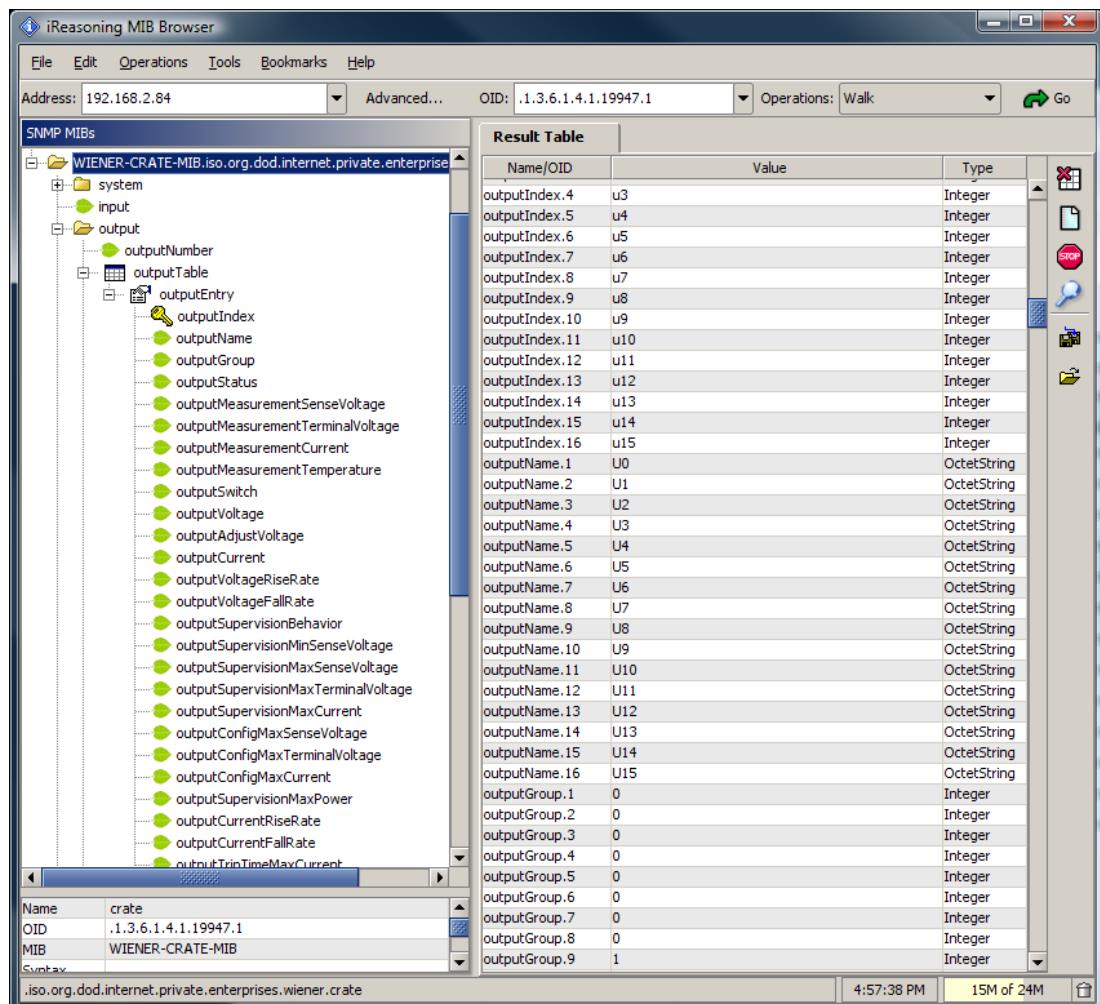

<http://www.ireasoning.com/mibbrowser.shtml>

[http://www.serverscheck.com/mib\\_browser/](http://www.serverscheck.com/mib_browser/)

<http://www.mibble.org/>

<http://www.ks-soft.net/hostmon.eng/mibbrowser/index.htm>

<http://www.tembria.com/products/snmpbrowser/index.html>

Result Table

Name/OID	Value	Type

## 4.10 A BASH Simple Script for SNMP

All of the commands above could be combined into scripts to set and monitor a predefined set of channels. For example a Bash script to read all channels and set the voltages and current limit to the same value for each channel could look like:

```
#!/bin/bash
# Simple Bash Script that will read and set all channels in a MPOD crate

ip=192.168.2.25
path=/usr/share/snmp/mibs
setVoltage=5
setCurrent=.100
setStatus=1
setRamp=100

channelCount=$(snmpget -Oqv -v 2c -M $path -m +WIENER-CRATE-MIB -c guru $ip
outputNumber.0)
indices=$(snmpwalk -Oqv -v 2c -M $path -m +WIENER-CRATE-MIB -c guru $ip
outputIndex)
x=`echo $indices | tr ' ' `

COUNTER=0
while [ $COUNTER -lt $channelCount ]; do
    index=$(echo ${x[$COUNTER]})

    voltage=$(snmpset -OqvU -v 2c -M $path -m +WIENER-CRATE-MIB -c guru $ip
outputVoltage.$index F $setVoltage)
    iLimit=$(snmpset -OqvU -v 2c -M $path -m +WIENER-CRATE-MIB -c guru $ip
outputCurrent.$index F $setCurrent)
    rampspeed=$(snmpset -OqvU -v 2c -M $path -m +WIENER-CRATE-MIB -c guru $ip
outputVoltageRiseRate.$index F $setRamp)
    status=$(snmpset -OqvU -v 2c -M $path -m +WIENER-CRATE-MIB -c guru $ip
outputSwitch.$index i $setStatus)

    voltage=$(snmpget -OqvU -v 2c -M $path -m +WIENER-CRATE-MIB -c guru $ip
outputVoltage.$index)
    iLimit=$(snmpget -OqvU -v 2c -M $path -m +WIENER-CRATE-MIB -c guru $ip
outputCurrent.$index)
    sense=$(snmpget -OqvU -v 2c -M $path -m +WIENER-CRATE-MIB -c guru $ip
outputMeasurementSenseVoltage.$index)
    current=$(snmpget -OqvU -v 2c -M $path -m +WIENER-CRATE-MIB -c guru $ip
outputMeasurementCurrent.$index)
    rampspeed=$(snmpget -OqvU -v 2c -M $path -m +WIENER-CRATE-MIB -c guru $ip
outputVoltageRiseRate.$index)
    status=$(snmpget -OqvU -v 2c -M $path -m +WIENER-CRATE-MIB -c guru $ip
outputSwitch.$index)

    echo "$voltage $iLimit $sense $current $rampspeed $status"

    let COUNTER=COUNTER+1
done
```

## 4.11 MPOD SNMP Parameter List (most common)

(see SNMP tree structure at end of manual for full structure)

## 4.12 iseg SNMP Control Program (NETSNMP)

The supplied iseg SNMP Control program allow controlling high voltage channels for configurations of up to 10 HV modules plugged in the MPOD. The programs are provided as executable. All source code is available on the CD-ROM.

## 4.13 C++ programming (NetSNMP)

Using NetSNMP C++ programs can be easily written for monitoring and control of MPOD high voltage modules. For Windows all needed functions are provided by a dynamically loadable library WIENER\_SNMP.DLL. This DLL requires NETSNMP and the WIENER –CRATE-MIB.txt file as described in chapter 4.4!

The following functions are provided in this library (for details see source code):

```
SnmpInit
SnmpCleanup
SnmpOpen
SnmpClose

getMainSwitch
setMainSwitch
getMainStatus
getVmeReset
setVmeReset

getOutputNumber
getOutputGroups
getOutputGroup
getChannelStatus
getOutputSenseMeasurement
getOutputTerminalMeasurement
getCurrentMeasurement
getTemperatureMeasurement
setChannelSwitch
getChannelSwitch
getOutputVoltage
setOutputVoltage
getOutputCurrent
setOutputCurrent
getOutputRiseRate
setOutputRiseRate
getOutputFallRate
setOutputFallRate
getOutputSupervisionBehavior
setOutputSupervisionBehavior
getOutputSupervisionMinSenseVoltage
setOutputSupervisionMinSenseVoltage
getOutputSupervisionMaxSenseVoltage
setOutputSupervisionMaxSenseVoltage
getOutputSupervisionMaxTerminalVoltage
setOutputSupervisionMaxTerminalVoltage
getOutputSupervisionMaxCurrent
setOutputSupervisionMaxCurrent
getOutputSupervisionMaxTemperature
getOutputConfigMaxSenseVoltage
getOutputConfigMaxTerminalVoltage
getOutputConfigMaxCurrent
getOutputConfigMaxPower

getSensorNumber
getSensorTemp
getSensorWarningTemperature
```

*setSensorWarningTemperature  
getSensorFailureTemperature  
setSensorFailureTemperature*  
*getPsOperatingTime*  
*getFanOperatingTime  
getFanAirTemperature  
getFanSwitchOffDelay  
setFanSwitchOffDelay  
getFanNominalSpeed  
setFanNominalSpeed  
setFanNominalSpeed  
getFanNumberOfFans  
getFanSpeed*  
*snmpSetDouble  
snmpGetDouble  
snmpSetInt  
snmpGetInt*

## 5 MPOD Crate

Powered chassis for multichannel high voltage modules

<b>Construction</b>	<b>8 U x 19" crate</b>	max.10 modules, up to 3 kW output power / 3,6kW input power
<b>Slots:</b>	10 + ½ (MPOD controller)	
<b>Dimensions (w, h, d)</b>	483 mm x 460mm x 355 mm	
<b>Weight:</b>	31,5 kg	

## 6 Primary Power Supply

The power supply provides all necessary supply voltages for the HV-Modules.

It is connected to the mains (World wide input 100..240V AC, 50..60 Hz).

- World wide input: 100..240V AC, 50..60 Hz, single phase
- Sinusoidal current input, up to 16A, depending on the used modules

### 6.1 Power Box Data Sheet

3U box with max. 6 power modules.

#### Mains Input

<b>Rated Input Voltage:</b>	106 – 230 V AC, +/- 15% variation allowed
<b>Rated Input Current:</b>	16 A
<b>Sinusoidal:</b> (230VAC)	CE CE EN 60555, IEC 555 pow. fact. 0,98
<b>Inrush current:</b>	16 A, cold unit
Input protection:	An external fuse or circuit breaker has to be installed (16A max.)
RF rejection:	EN 55 022 Class B, Input and Output
Output protection overload:	current limiting for booster circuits, 90°C cut off temperature
<b>Dimensions:</b>	4U x 14 PU width acc. to IEC 60297, 450 mm deep
<b>Weight:</b>	4,7 kg
<b>Operation temperature:</b>	0....45°C without derating, storage: -30°C ... + 85°C
<b>M T B F</b>	electronics: 40°C ambient: > 100 000 h
	integrated fan: 40°C ambient: ca. 65 000 h, 25° ambient
>85000h	

## 7 SNMP examples for MPOD and high voltage EHS/EDS module

```
*****

## 9 MPOD Firmware Update

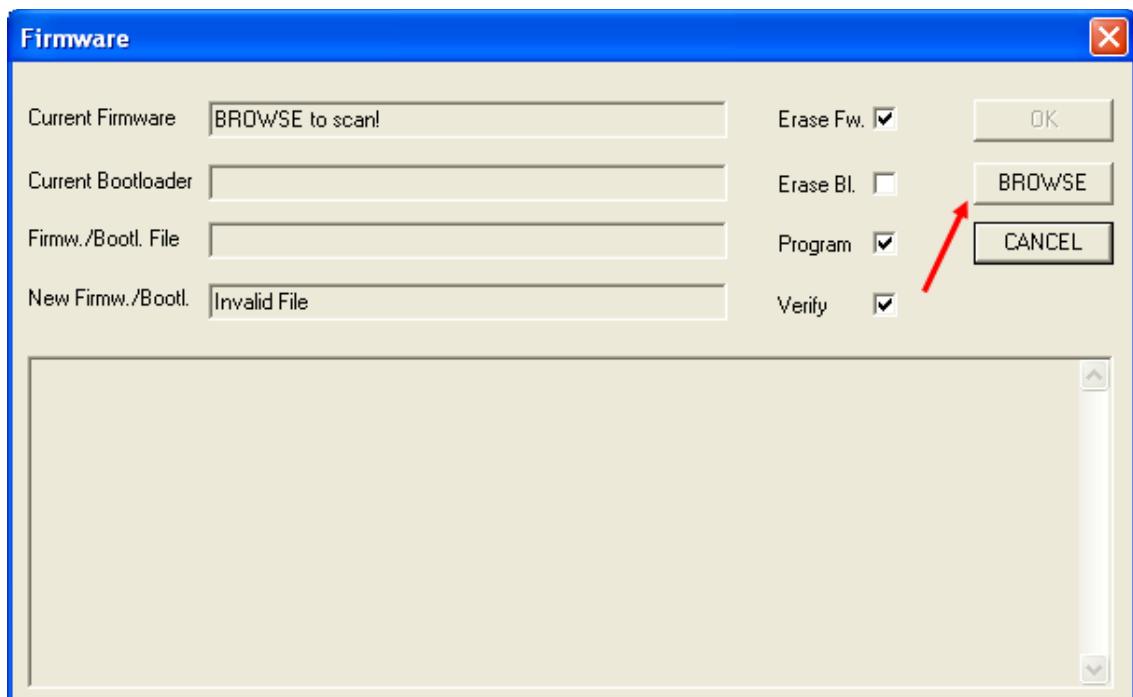

(for Bootloader from revision 1.5 and Firmware from revision 2.\*.0.15)

1) You need the MUSEcontrol program form revision 2.0.910.0. You can download it from the wiener web site "[www.wiener-d.com](http://www.wiener-d.com)" or via the direct link "<http://www.wienerd.com/Support/MUSEcontrol/MUSEcontrolInstall-2.0.910.0.exe>".

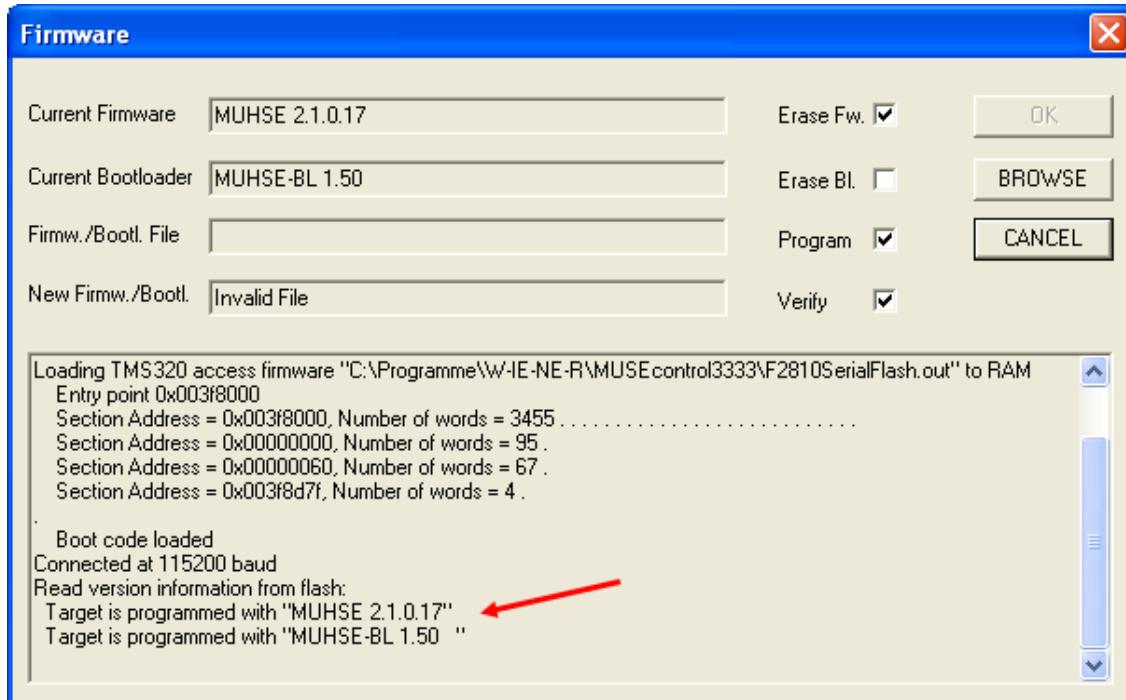

Start the MUSEcontrol program and select the tab "system". In the opened pull down menu select the item "Firmware Update" to update the device via USB.

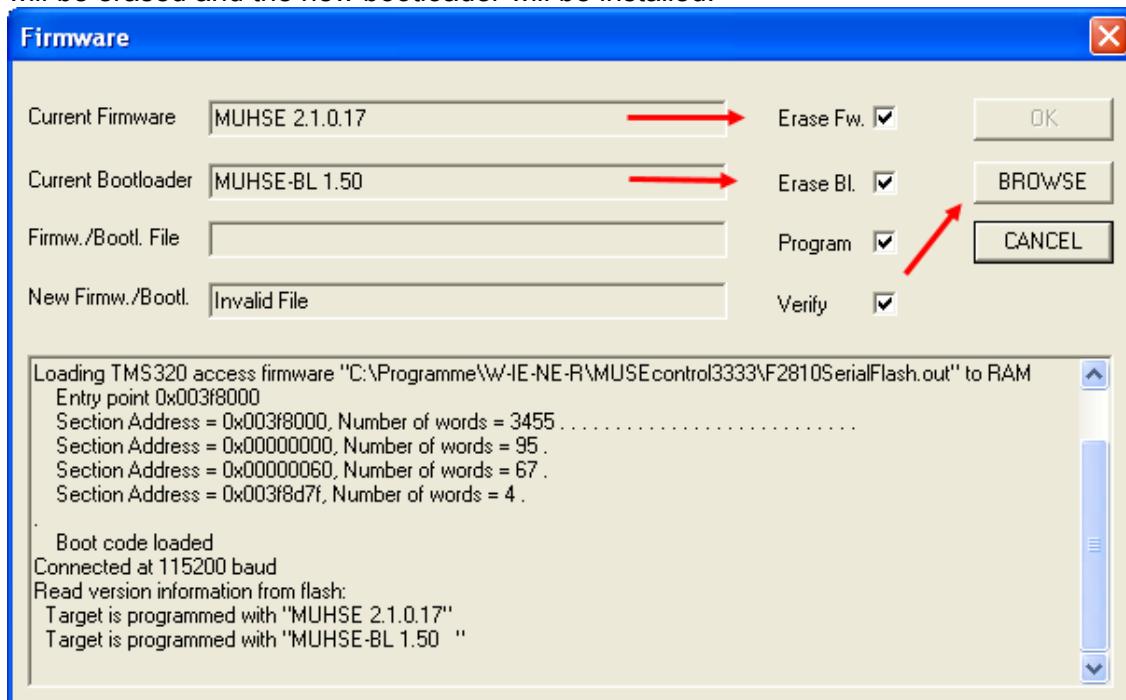

2) Hit the button "browse" to scan the device for current version of bootloader and firmware.

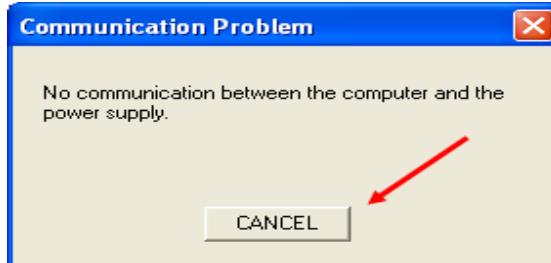

3) Check the version of the current firmware or bootloader. There are three options:

Option 1) Check “Erase Fw.” (erase firmware) and “Erase Bl.” (erase bootloader) if the current firmware is older than 2.\*.0.15 or it is a firmware without bootloader. After that push the button “browse” to scan the flash. In some minutes select the new bootloader file in the automatically opened file menu. Press the button “Ok”. Now the whole flash will be erased and the new bootloader will be installed.

When the install process is done hit the button “cancel” to restart the system. It is recommended to close the MUSEcontrol program before restarting. A window which indicates a communication problem appears. The reason for this is that only the bootloader without firmware is installed. Ignore this message by pushing the button “cancel”.

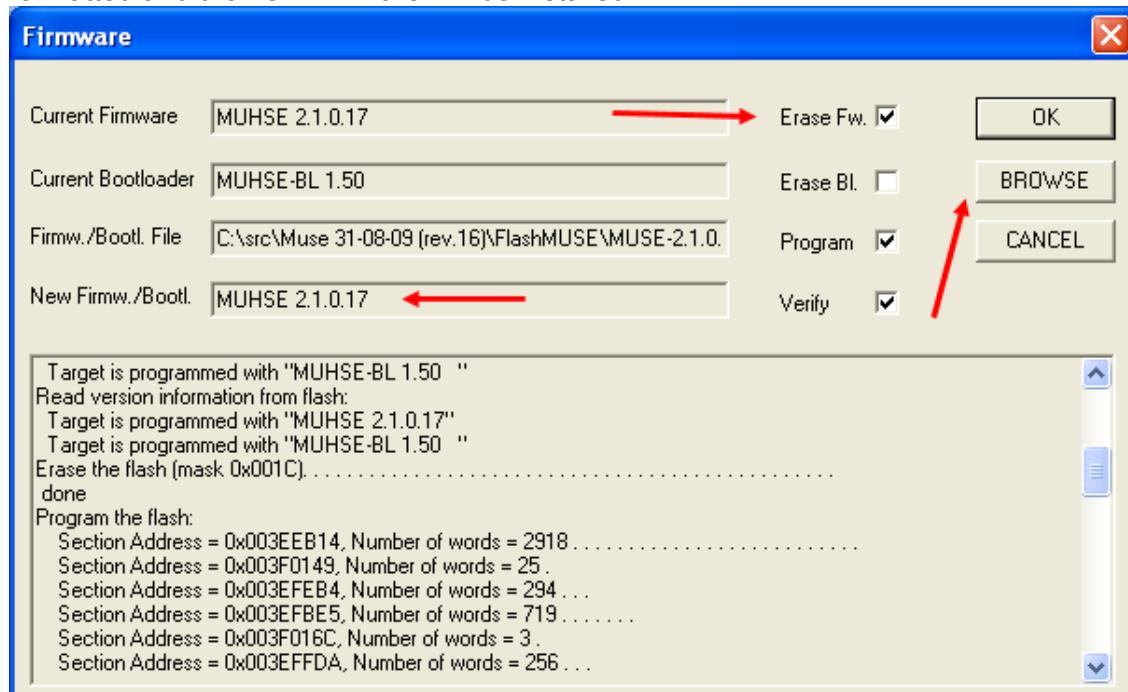

Also ignore the no modules message to hit the button "Ignorieren".

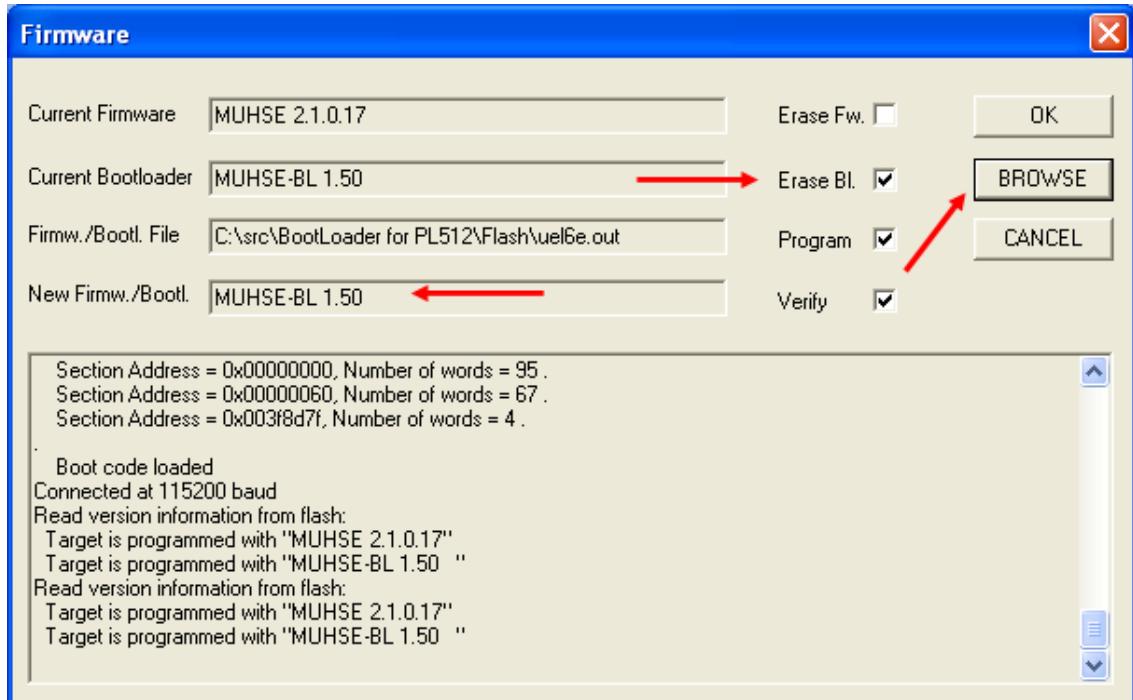

Follow the step 1 and 2. Execute the instructions of option 2.

Option 2) Check "Erase Fw." (erase firmware) if there no current, legal firmware is available or a newer one should be installed. After that push the button "browse" to scan the flash. In some minutes select the new firmware file in the automatically opened file menu. Press the button "Ok". Now the firmware partition in the flash will be formatted and the new firmware will be installed.

When the install process is done hit the button "cancel" to restart the system. It is recommended to close the MUSEcontrol program before restarting.

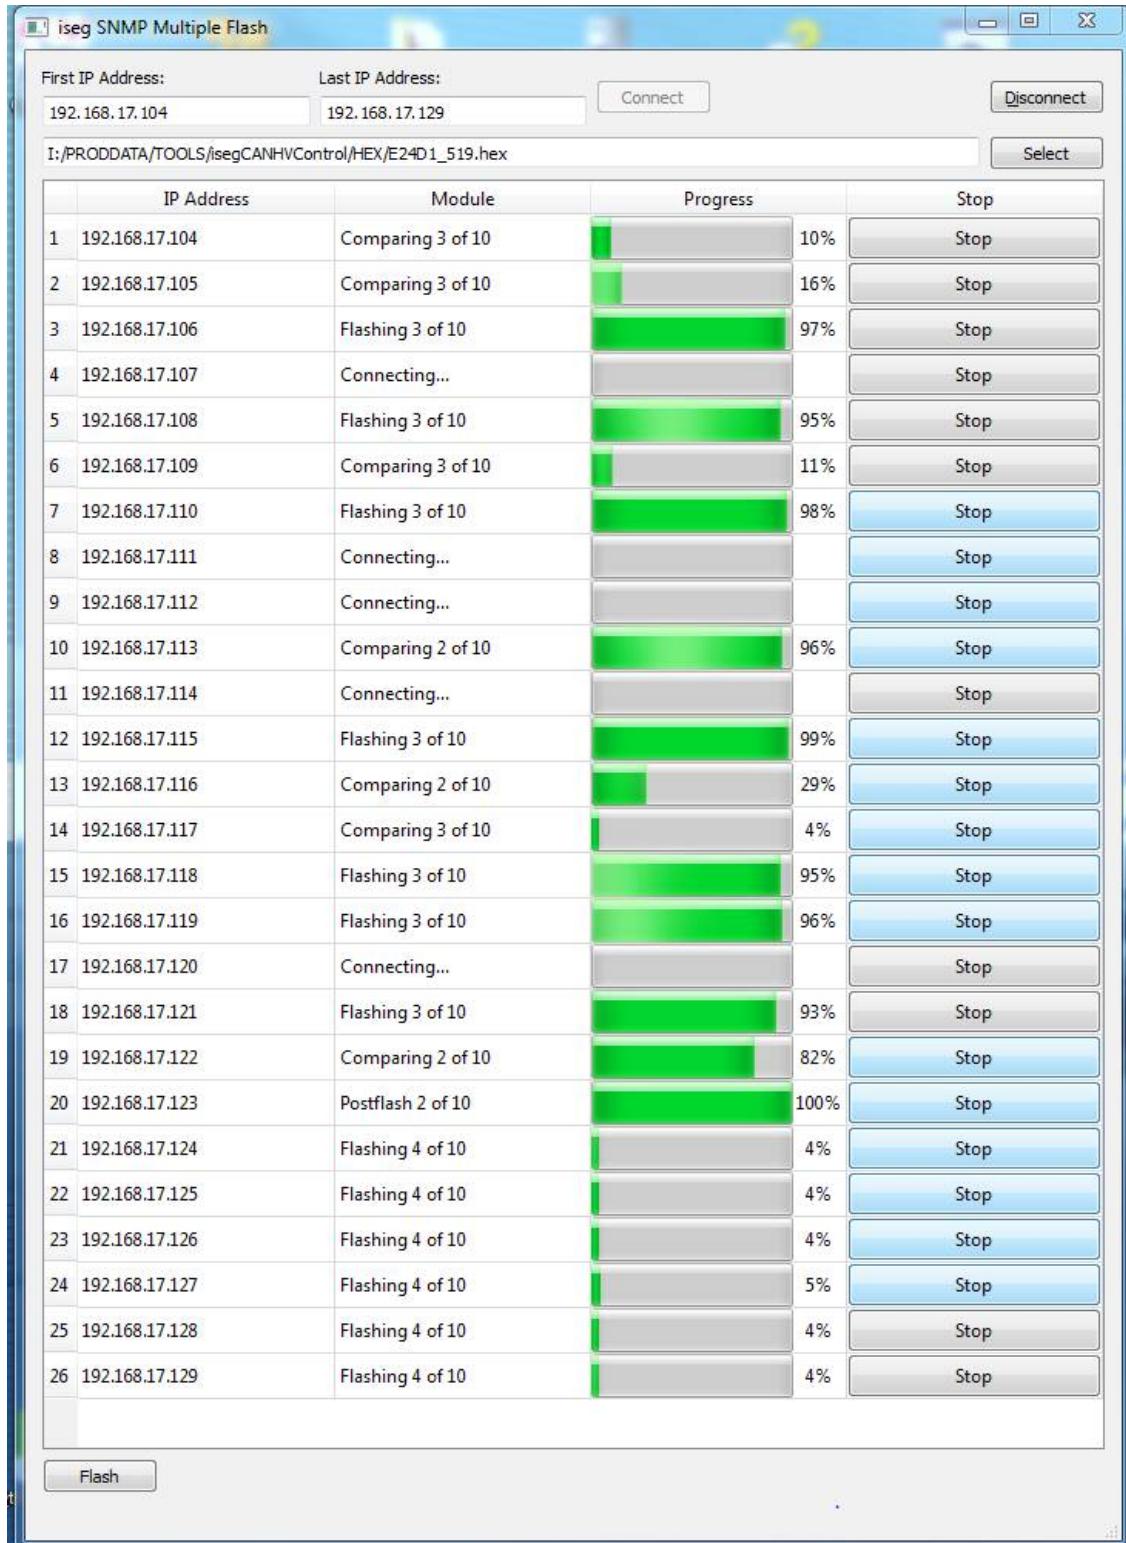

Option 3) Check "Erase Bl." (erase bootloader) if there an older bootloader (from version 1.5) and a newer one should be installed. If no bootloader is available chose option 1. After that push the button "browse" to scan the flash. In some minutes select the new bootloader file in the automatically opened file menu. Press the button "Ok". Now the bootloader partition in the flash will be formatted and the new bootloader will be installed.

When the install process is done hit the button “cancel” to restart the system. It is recommended to close the MUSEcontrol program before restarting.

## 10 HV Modules Firmware Update

You need the program **iseg SNMP Multiple Flash** in order to execute a firmware update for the iseg HV modules. Input the first and the last IP address and push the Connect button. Now, the program locate the number of modules per MPOD IP address. After a time period of approximately 10 seconds for the module detection you must select the firmware update file. In this case the file

name is E24D1\_519.hex.

The firmware update process will be started by pushing the Flash button. Please calculate an update time period of approximately 30 minutes.
